// EVOLUTION FOR US IS A NATURAL MATTER //

Many geniuses and luminaries, such as Leonardo Da Vinci, have spent their lives seeking perfection and reflecting it in their projects, through an intensive study of the divine proportion.

Using the same philosophy, CDR also pursue the perfection without compromises in its products.

This is the fundamental that connects our milestones, an EVOLUTION that has pushed us to overcome traditional systems, leading us to be among the pioneers of magnetic drive technology.

// ... //

And now A step beyond...

Thanks to the magnetic drive technology, the rotating motion is transmitted without any mechanical contact, simply by exploiting the attraction of the magnetic fields.

Without any joint or sealing, it is achieved a complete liquid containment, eliminating risks of dangerous leakages: the safest system for the operator, as well the most respectful for the environment.

EVOlution phase two: we are proud to make a further step beyond and introduce you the new UTS EVO.

Principles of the magnetic drive (Magnetic drive concept)

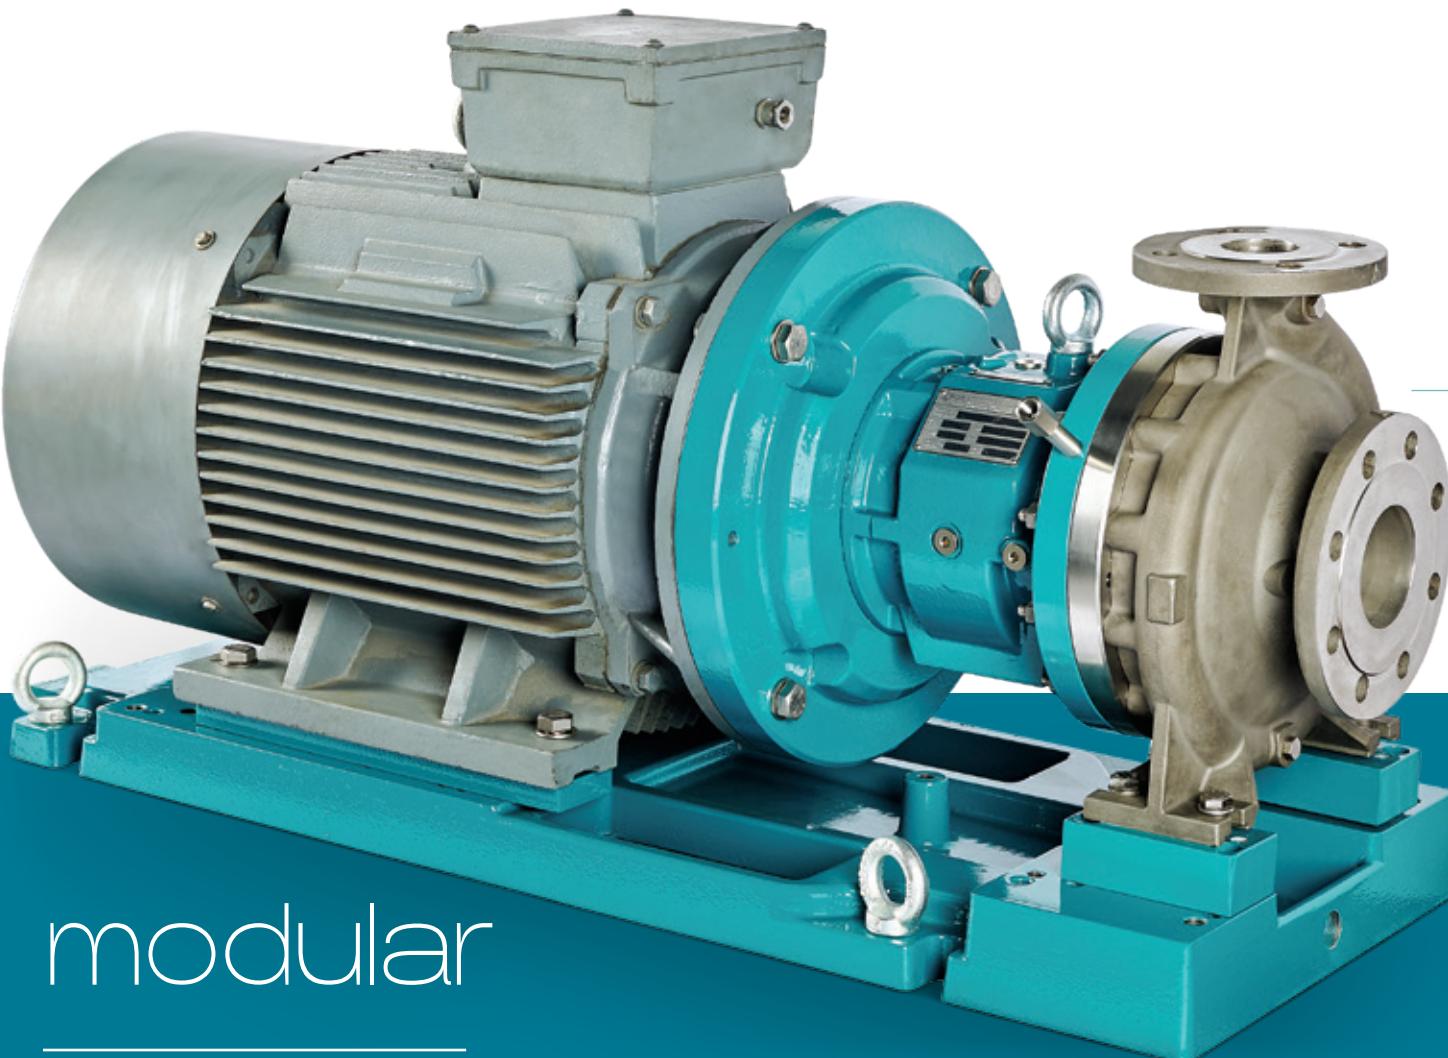

The torque is transmitted from the shaft to the impeller thanks to the magnetic coupling: the external magnet (connected to the motor) drives the internal magnet (solid to the impeller), without any direct or physical contact. The transmission of the rotating motion to the impeller is ensured by just magnetic forces of attraction / repulsion between the two magnets. An isolation shell guarantees the complete isolation of the pumping liquid from the external environment.

UTS

Bareshaft version
“back pull out”.
Baseplate installation
couplings and coupling
guards motor frame B3.

evo

Evolution of the UTS range introduced in 1996, the new UTS is now redesigned and updated (upgraded) with new features that make it more competitive, reliable, with enhancing performances.

modular

New magnetic couplings: excellent performance even in case of pumping high viscous liquids.

UTS-B

Close-coupled version with standard motor frame B5, now also available with motor frame B35 New baseplate.

design

Ideal solution for handling toxic, flammable and dangerous liquids. Thanks to the internal ATEX certification, also suitable to handle non-conductive liquids.

Application Fields

Distillation
processes

Raw chemical
processes
Operation h24

Fine chemistry
processes

Thermoregulation

Tank loading /
Unloading

Pharma-Chemical
Industries

Painting standards

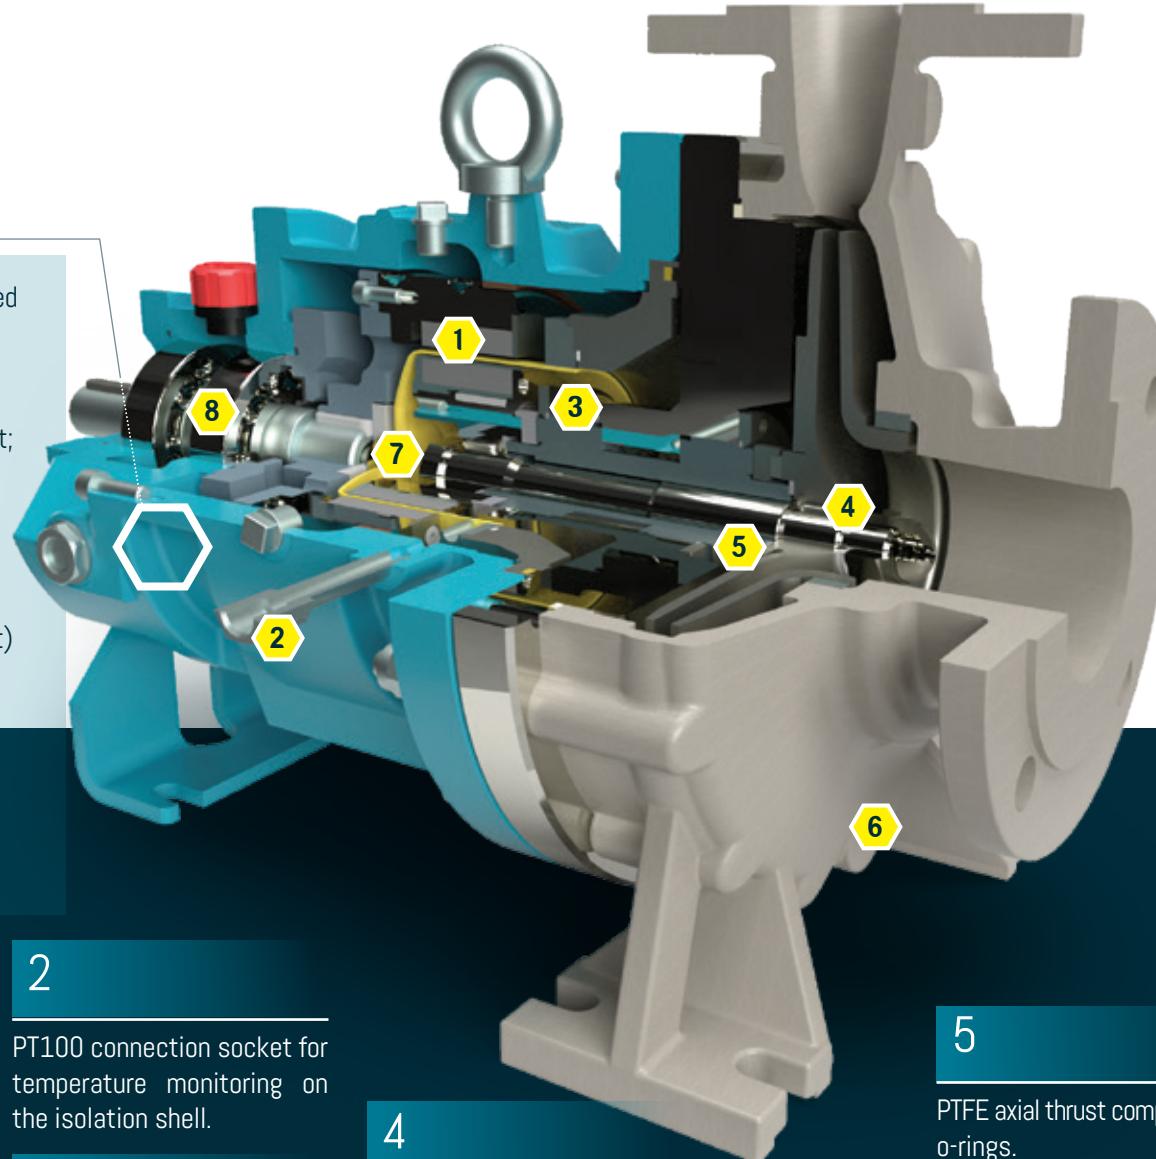

Cast iron surfaces are protected by 3 paint layers (total 240 microns):

- First layer: epoxy primer paint;
- Intermediate layer: Amide-vinyl primer;
- External layer: Epoxy paint;

RAL 5021 color
(all colors available on request)

Painting standard available:

- Standard EN ISO 12944-5 C4M syst. A4.14
- On request EN ISO 12944-5 C4H, C5I, C5M

1

Magnets can be in SmCo or NdFeBo according to the temperature of the pumped fluid. Different magnet lengths allow to optimize the power consumption.

2

PT100 connection socket for temperature monitoring on the isolation shell.

3

The internal flushing channels allow the efficient removal of the heat generated by bushes friction and isolation shell eddy currents.

4

The shaft with a central flushing channel allows the correct internal circulation of the liquid, from the rear isolation shell to the front volute casing.

5

PTFE axial thrust compensation o-rings.

6

Threaded casing drain as a standard.

8

Available on request heatsink and bearing protection with no-contact labyrinth seals.

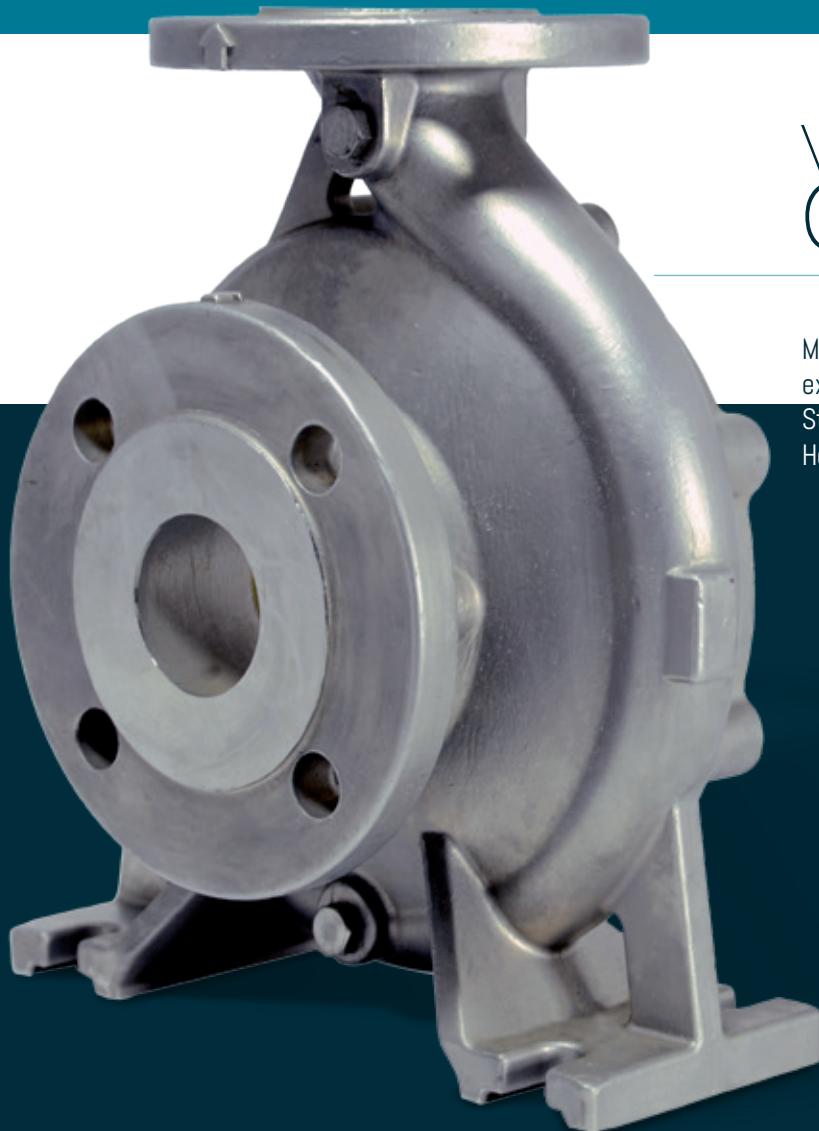

Internal magnet: different magnet design guarantees improved performances with viscous liquids.

7

An isolation shell in Hastelloy-C 276 guarantees excellent corrosion resistance. With 3 different sizes efficiency is remarkably improved. Also available in ZrO₂.

Construction Details

Volute Casing

Made in cast steel AISI 316, it ensures excellent corrosion resistance. Standard threaded drainage. Heating jacket available on request.

Impeller

Made in cast steel AISI 316 (14408), it guarantees excellent and precise vanes profile design and corrosion resistance. The counter-vanes reduce the axial thrusts and, as consequence, the wear of the internal components.

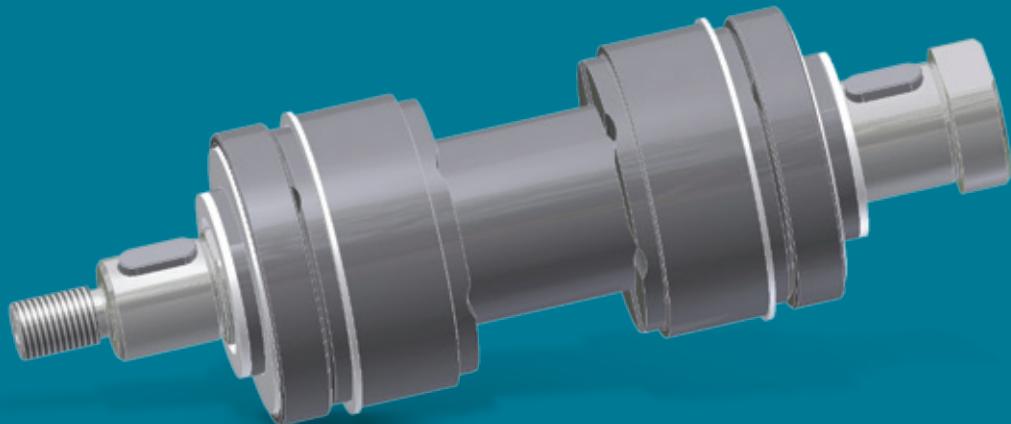

Static and Rotating Bushes

The rotating shaft is mounted inside a SIC bush, supported by 2 static bushes: this configuration guarantees high reliability in continuous service, distributing correctly the axial and radial thrusts.

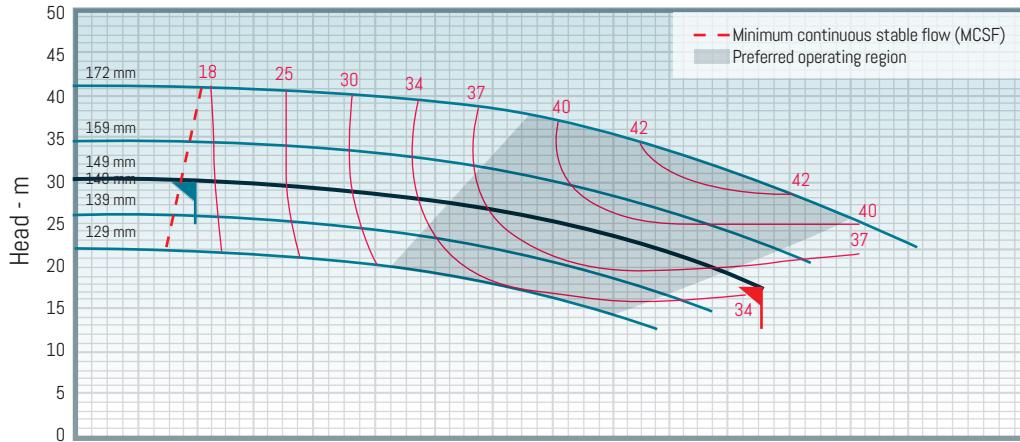

PTFE compensating rings guarantee high resistance to the impeller axial thrusts.

Bushes Support

Flanged bushes support, also available in a pre-assembled kit with bushes already installed, for a quick and safe maintenance.

Diamond Coated SiC bushes:

In case of high risk of dry running, it is available on request a kit (shaft / bushes / axial thrusts) in diamond-coated SiC (RSSiCtm). The surface treatment grants both hardness and a friction reduction of about 80% (0.04 µrs of RSSiC versus 0.4 - 0.7 µrs of SiC).

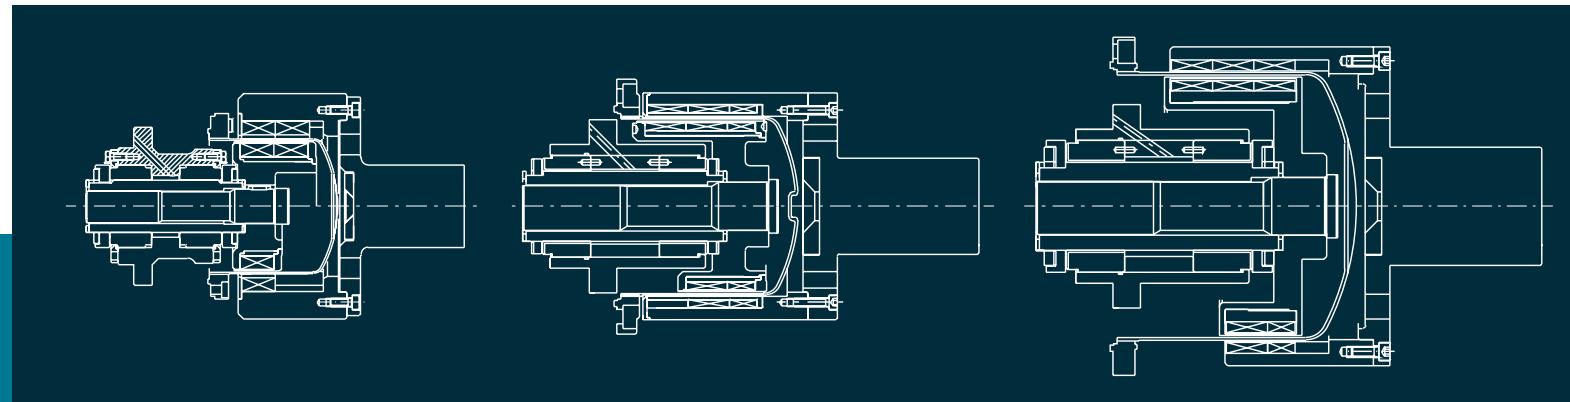

Other critical working conditions on which RSSiC increases reliability and pump life-time are:

- Pumping of low boiling liquids
- Operation at low flow rates (near MCSF): the heat generated by the magnetic coupling (eddy current) is not completely dissipated by the process fluid recirculation
- Operation at high flow rates (beyond the BEP): under these conditions it may occur either a cavitation or a not correct heat dissipation in the rear area of isolation shell, as discharge pressure is low.

New Magnetic Couplings

The redesign of the 3 magnetic couplings improve the efficiency, demanding less energy for the same duty. The Isolation shells are made by flow-forming, to avoid any internal material tension. The flow-breaking seat on the bottom of the isolation shell avoids the formation of liquid vortex inside the pump PT100 connection socket for temperature monitoring as a standard.

Coupling "125"

Max power 18,5kW*

Coupling "160"

Max power 37kW*

Coupling "250"

Max power 90kW*

*2900 rpm

Zirconium oxide and energy saving.

In order to eliminate the eddy currents generated by the Hastelloy Isolation shell, a zirconium oxide ZrO₂ isolation shell is available upon request

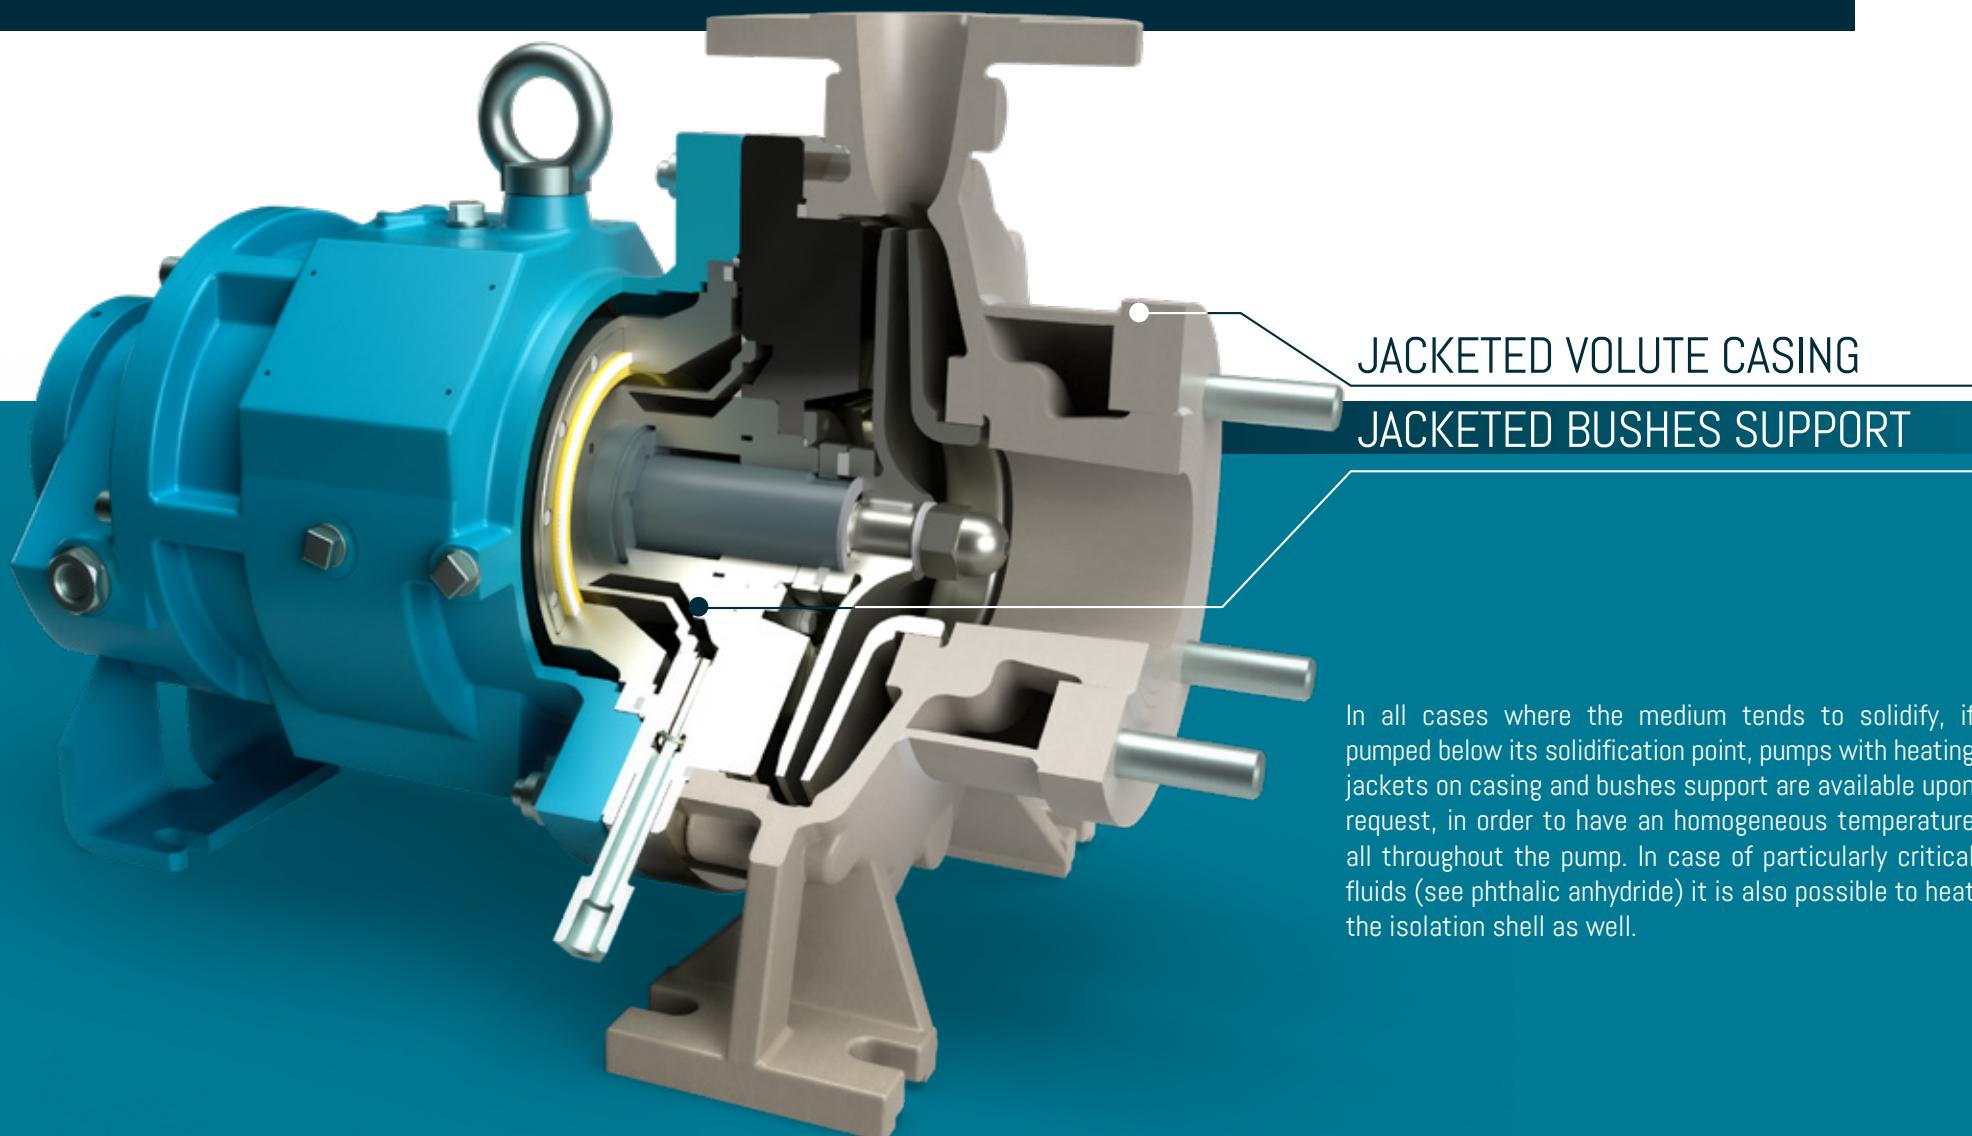

Advantages of the ZrO₂ Isolation shell:

- Reduction of absorbed power up to 25%, resulting in the increase in pump efficiency.
- Removal of the Joule effect caused by eddy currents. This is essential in all cases where pumping low-boiling fluids or liquids subject to evaporation
- Preservation and stability of the liquid temperature, in conditions where duty is close to the admissible minimum flow

// EVOLUTION FOR US IS A NATURAL MATTER //

Heating jacket arrangement

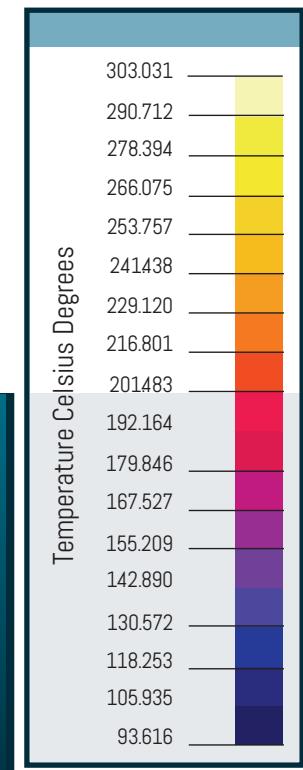

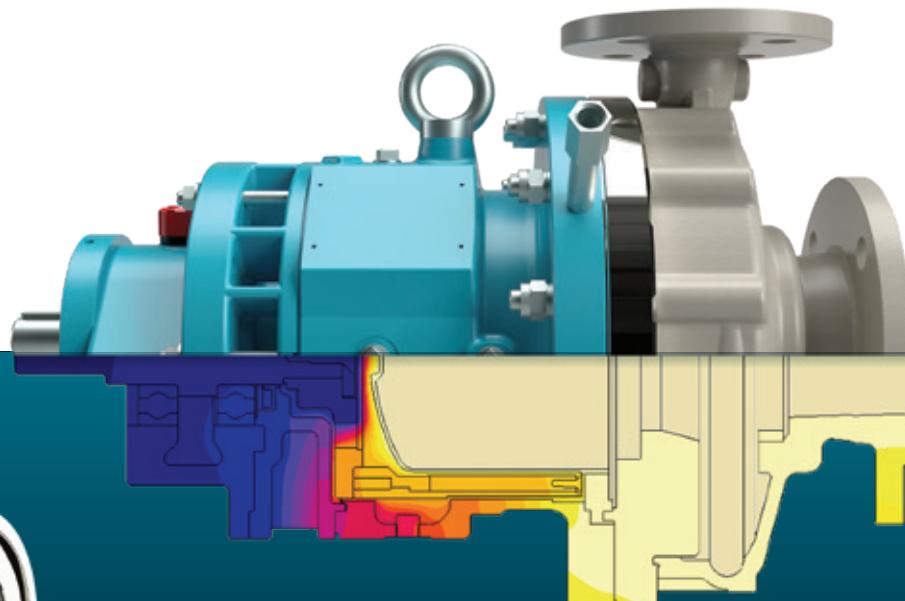

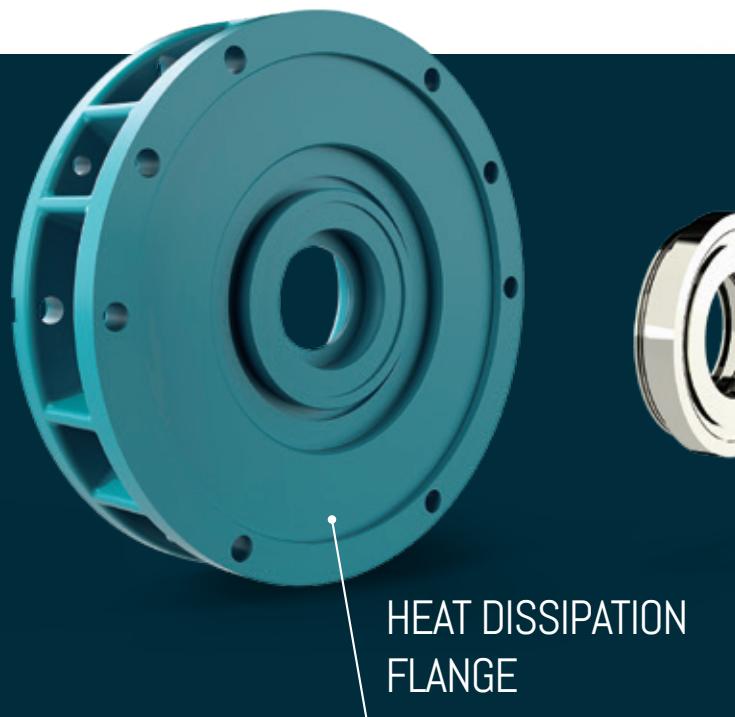

High temperature Execution

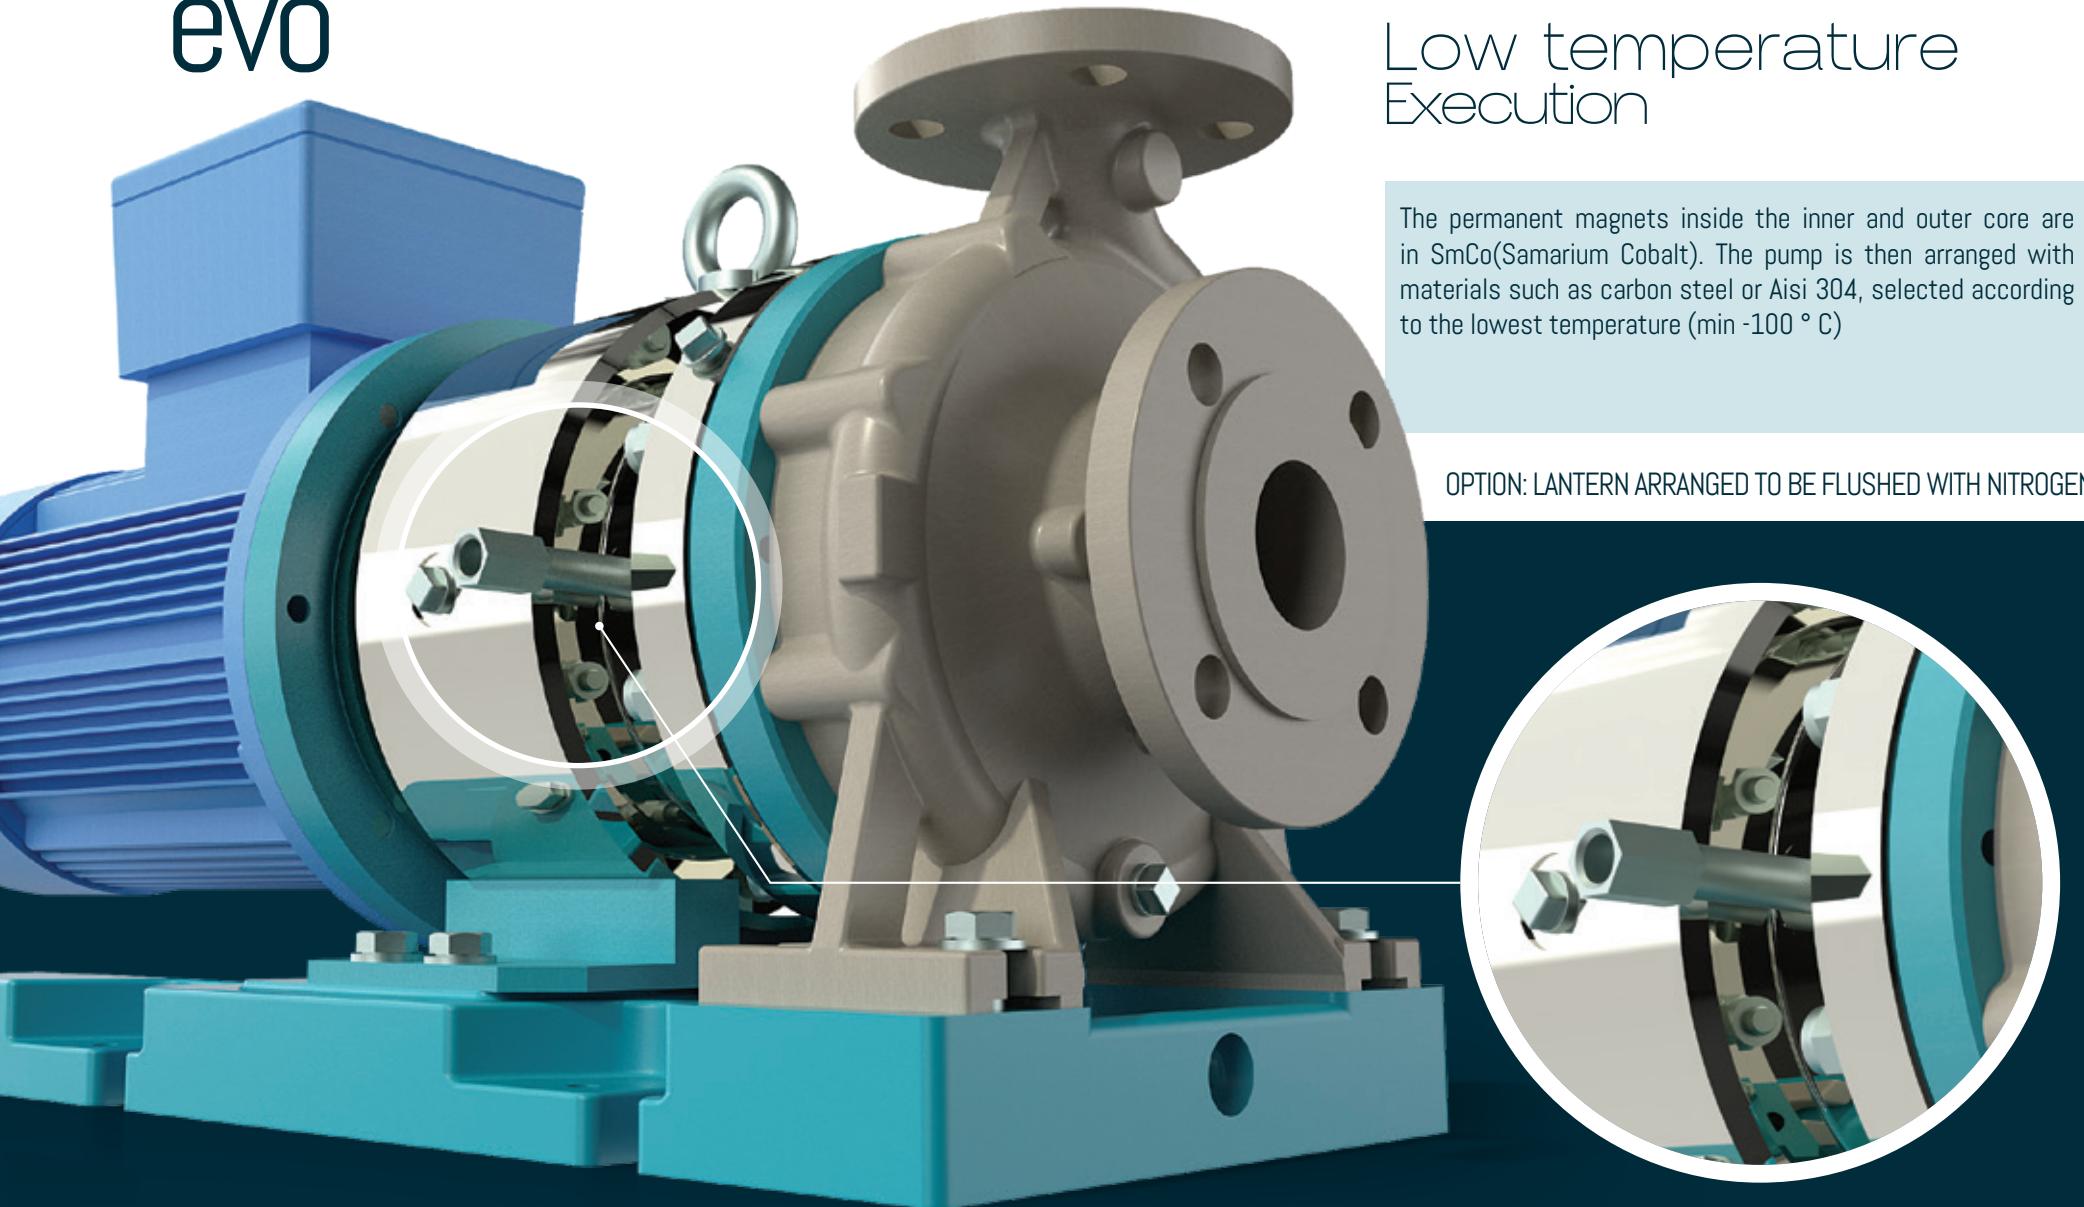

Internal and external magnets are made of:

- NdFeBo for temperatures up to 180 ° C
- SmCo for temperatures up to 300 ° C

For continuous operation at Temp > 200 ° C,
it is provided a bearing support arranged with
no-contact oil seal rings (labyrinth seal type).

CHROMATIC TEMPERATURE MAP (FLUID at 300 ° C)

Low temperature Execution

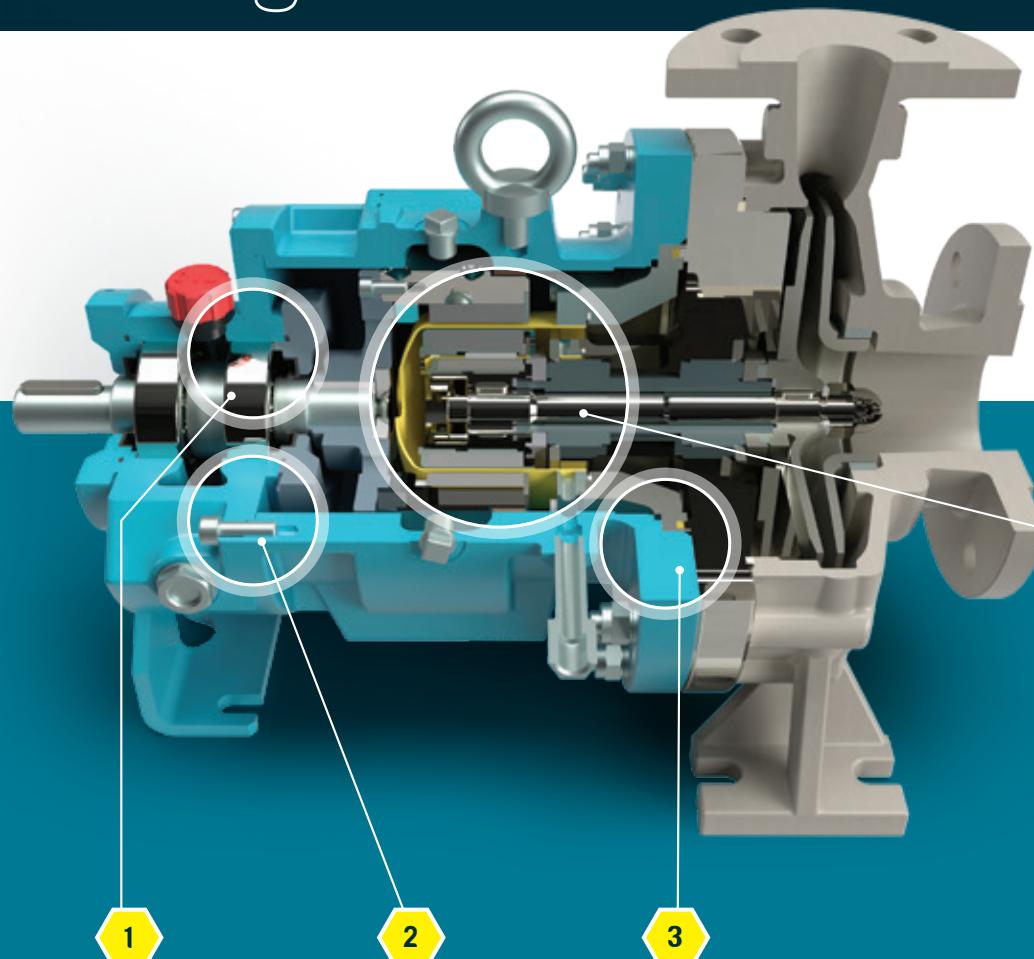

The permanent magnets inside the inner and outer core are in SmCo(Samarium Cobalt). The pump is then arranged with materials such as carbon steel or Aisi 304, selected according to the lowest temperature (min -100 ° C)

OPTION: LANTERN ARRANGED TO BE FLUSHED WITH NITROGEN

Enhanced safety: Double Containment and Leakages Detection

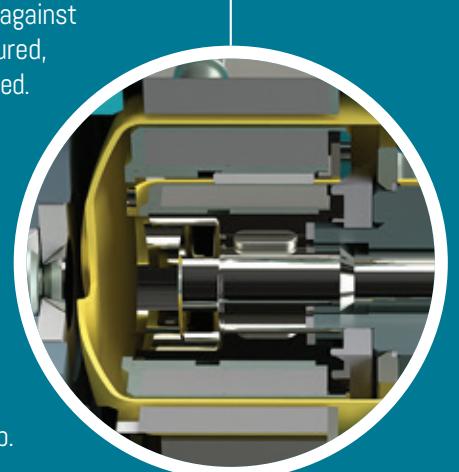

Double containment + Level switch

In all the cases where the safety level against external contamination must be assured, the lantern can be used as a secondary containment. Any possible leakage of the pumped liquid caused by the isolation shell failure, is thus fully contained within the lantern, by mounting a sealing ring instead of the classic corteco / oil seal (1). The containment is also guaranteed by specific o-ring seals located in all critical areas (2) (3). Providing then a level switch on the bottom of the lantern, it is possible to stop the pump as soon as any internal leakage is detected.

Double Isolation Shell + Pressure switch

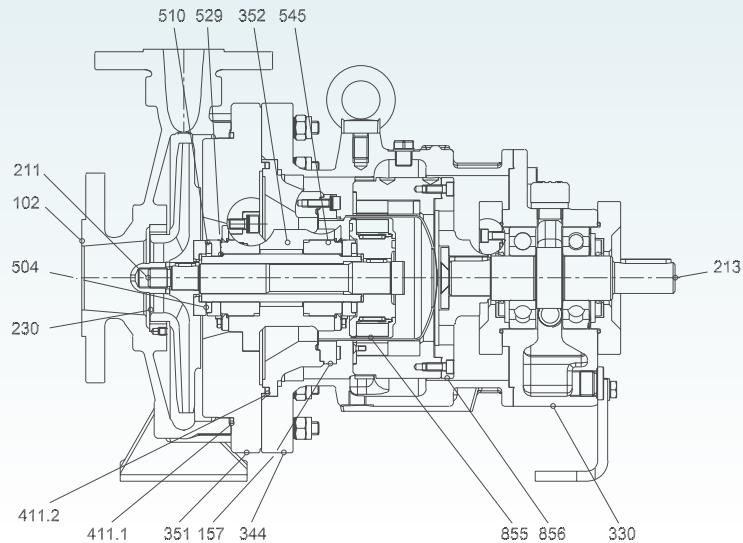

In all the cases where the safety level against external contamination must be assured, a secondary isolation shell may be installed. Any possible leakage of the pumped liquid caused by the failure of the primary isolation shell in Hastelloy, is thus fully contained within the isolation shell in ZrO₂ which works as a secondary containment. The presence of the liquid between the two isolation shells can be detected through a pressure switch which promptly intervenes stopping the pump.

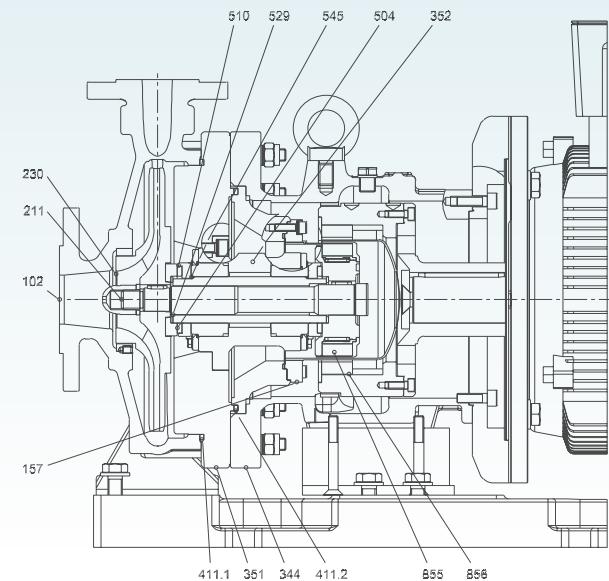

TECHNICAL SPECIFICATIONS

Performances at 2900 rpm	Q max = 320 m ³ /h -> H max = 95 mcl
